Starter Edition

The starter edition is the right choice for institutions that need to perform low-scale testing and collect quality reports securely. This is a simple solution for clients for whom testing, and analysis processes are not a critical aspect of the business and do not require integration with other systems. However, even with this option, you get a lot of attractive features, such as:
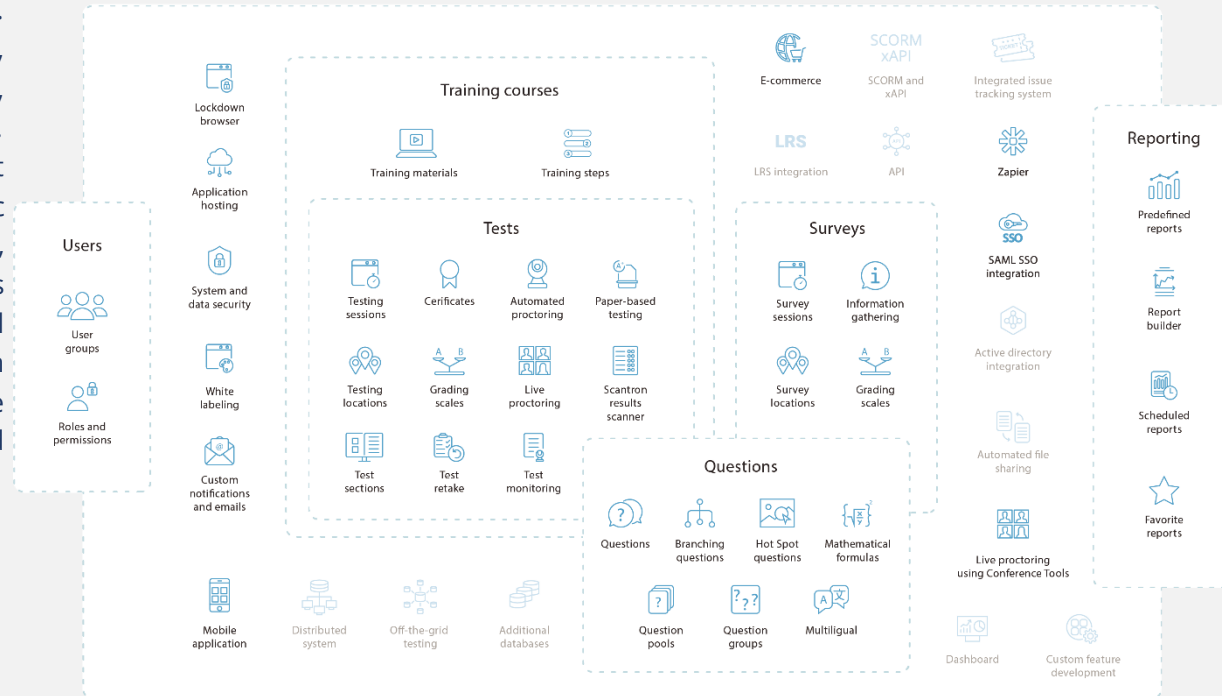

✓ Online examination
✓ Organization of users into groups
✓ Organization of question pools
✓ Generating tests from pool questions
✓ Report builder and numerous predefined reports
✓ Custom certificate tool
✓ Custom grading scales
✓ Import and export of data from the tabular format
✓ Possibility of testing on paper
✓ Unlimited number of administrators and the ability to create other roles
✓ E-commerce
✓ Surveys and training courses

A typical case of using the Starter Edition is scheduling with or without AI proctor monitoring for different users and groups at different times and collecting automatically created examination reports. Optionally charge the exam attempts using our E-commerce module.

Standard Edition

The standard edition is a reliable solution for someone whose business is largely based on knowledge evaluation and data collection processes. This option allows you to brand the application, change the complete static content (notifications, labels, descriptive texts, emails) and put your logo. Tests can be automatically translated into different languages. Additionally, you can define automatic processes in the system's background – for example, exchanging files at defined shared locations. This version of the application contains all commercial features except the possibility of integration with other systems. In addition to the feature from the Starter Edition, you can also create surveys and training courses.

The complete list of features is:

- ✓ All features from Starter Edition
- ✓ Scantron import/export
- ✓ Scheduled reports/password-based authentication
- ✓ White labeling
- ✓ Mobile application
- ✓ Multilingual tests
- ✓ Automated file sharing
- ✓ Custom emails and notifications
- ✓ SAML 2.0 Single Sign-on,
- ✓ Zapier integration
- ✓ Job scheduling dashboard

In addition to the flexible organization of tests, one of the possible scenarios is the organization of various types of branded tests and surveys and their joining the training courses enriched with multimedia. After the assessments, the results are automatically sent to the defined addresses.

Enterprise Edition

The enterprise edition (EE) is a solution for users who need knowledge testing and evaluation software to be integrated with other parts of their enterprise organization. By selecting the EE version of the application, you can exchange information using some known standards and tools, such as Zapier or LRS, or leverage on YouTestMe API. You can synchronize user-profiles and enable automatic login using SSO mechanisms. Given the system's complexity and possible integration, our team conducts a complete on-boarding process and creates a personalized help center for your users.

The complete list of EE version options is as follows:

- ✓ All features from Standard Edition
- ✓ LRS Integration (xAPI)
- ✓ Microsoft Active Directory Integration
- ✓ Custom feature development
- ✓ Dashboard
- ✓ Seamless integration using encoded links and webhooks
- ✓ Premium features such as distributed system, data encryption at-rest, off-grid testing without the internet and power supply, integrated ticketing system

A typical usage scenario is the sharing 'deep links' to YTM tests in other applications used by the customer. Since users automatically synchronize, it is possible to automatically start the test by clicking on the external system's link. After the test is done, the report is automatically returned to the system from where it started using webhooks.

Purchase Application

In addition to renting services, YouTestMe also enables the entire system's purchase through a one-time fee payment or rent-to-own model. This option allows you to host the application on servers of your choice. It can be a closed network on your premises or another cloud host. Application maintenance is easy and automated and requires almost no time spent by your administrators.

You can sign up for customer support and thus receive regular application upgrades. This is a preferred choice of government institutions, where it is required to keep data within the institution and be independent of vendors. Also, in the long run, this is the most cost-effective option.
